```
This sequence represents an extendin-4 active fragment peptide sequence. Extendin-4 is a peptide produced in the salivary gland of the Gila Monster lizard. Extendin-4 has been shown to promote insulin secretion, and given in equimolar quantities, is more potent than glucagon-like protein-1 (GLP-1) at causing insulin release from insulin producing cells. GLP-1 is a hormone normally secreted by neuroendocrine cells of fragments can be used in the production of a population of insulin-producing cells from a population of non-insulin producing cells. The methods may also be used to promote pancreatic amylase producing cells to produce both insulin and amylase. The methods may also be used do premote pancreatic amylase producing cells to maylase. The methods are used to treat diabetes mellitus (type 1) in humans, domesticated animals, livestock and pets
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Differentiation of non-insulin producing cells into insulin-producing cells by glucagon-like peptide-1 or extendin-4, used to treat diabetes mellitus.
                                                                                                                                                                                                                                                                                                                                                        Extendin-4; Gila Monster lizard; insulin producing cell; insulin; amylase; diabetes mellitus type 1; human; livestock; pet.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAY78961;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Egan J,
                                                                                                                                                                                                Egan J,
   This sequence represents an extendin-4 active fragment peptide sequence. Extendin-4 is a peptide produced in the salivary gland of the Gila Monster lizard. Extendin-4 has been shown to promote insulin secretion, and given in equimolar quantities, is more potent than glucagon-like protein-1 (GLP-1) at causing insulin release from insulin producing cells. GLP-1 is a hormone normally secreted by neuroendocrine cells of the gut, in response to food. GLP-1 fragments or Extendin-4 growth factor fragments can be used in the production of a population of insulinproducing cells from a population of non-insulin producing cells. The methods may also be used to promote pancreatic amylase producing cells to produce both insulin and amylase. The methods are used to treat diabetes mellitus (type 1) in humans, domesticated animals, livestock and pets
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Differentiation of non-insulin producing cells into insulin-producing cells by glucagon-like peptide-1 or extendin-4, used to treat diabetes
                                                                                                                                       -4; Gila Monster lizard; insulin producing cell; insulin; diabetes mellitus type 1; human; livestock; pet.

Extendin-4 is a peptide produced in the salivary gland of the Gila Monster lizard. Extendin-4 has been shown to promote insulin secretion, and given in equimolar quantities, is more potent than glucagon-like protein-1 (GiP-1) at causing insulin release from insulin producing cells. GiP-1 is a hormone normally secreted by neuroendocrine cells of the gut, in response to food. GiP-1 fragments or Extendin-4 growth factor fragments can be used in the production of a population of insulinmethods may also be used to production of anylase producing cells. The methods may also be used to promote pancreatic amylase producing cells to produce both insulin and amylase. The methods are used to treat diabetes mellitus (type 1) in humans, domesticated animals, livestock and pets
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                sequence represents an extendin-4 active fragment peptide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                       Differentiation of non-insulin producing cells into insulin-producing cells by glucagon-like peptide-1 or extendin-4, used to treat diabetes mellitus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Extendin-4; Gila Monster lizard; insulin producing cell; insulin; amylase; diabetes mellitus type 1; human; livestock; pet.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAY78960 Length: 36 February 4, 2005 13:20 Type: P Check: 333 Found using 'seq4' (mohamed337.key)

                                                                                                                                                                                                                                                                                                                            This sequence represents an extendin-4 active fragment peptide sequence. Extendin-4 is a peptide produced in the salivary gland of the Gila monster lizard. Extendin-4 has been shown to promote insulin secretion, and given in equimolar quantities, is more potent than glucagon-like protein-1 (GLP-1) at causing insulin release from insulin producing cells. GLP-1 is a hormone normally secreted by neuroendoorine cells of the gut, in response to food. GLP-1 fragments or Extendin-4 growth factor fragments can be used in the production of a population of insulin producing cells from a population of non-insulin producing cells. The methods may also be used to promote pancreatic amylase producing cells to produce both insulin and amylase. The methods are used to treat diabetes mellitus (type 1) in humans, domesticated animals, livestock and pets
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents an extendin-4 active fragment peptide sequence. ```
and given in equimolar quantities, is more potent than glucagon-like protein-1 (GLP-1) at causing insulin release from insulin producing cells. GLP-1 is a hormone normally secreted by neuroendocrine cells of the gut, in response to food GLP-1 fragments or Extendin-4 growth factor fragments can be used in the production of a population of insulin-producing cells from a population of non-insulin producing cells. The methods may also be used to promote pancreatic amylase producing cells to produce both insulin and amylase. The methods are used to treat diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents an extendin-4 active fragment peptide sequence. Extendin-4 is a peptide produced in the salivary gland of the Gila Monster lizard. Extendin-4 has been shown to promote insulin secretion, and given in equimolar quantities, is more potent than glucagon-like protein-1 (GLP-1) at causing insulin release from insulin producing cells. GLP-1 is a hormone normally secreted by neuroendocrine calls of fragments can be used in the production of a population of finsulin-producing cells from a population of non-insulin producing cells to produce both insulin and amplase. The methods may also be used to promote pancineatic amylase producing cells to produce both insulin and amplase. The methods are used to treat diabetes mellitus (type 1) in humans, domesticated animals, livestock and pets
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Differentiation of non-insulin producing cells into insulin-producing cells by glucagon-like peptide-1 or extendin-4, used to treat diabetes
                                                                                                                                                                                                                                                                                                                                                mellitus (type 1) in humans, domesticated animals, livestock and pets

```
This sequence represents an extendin-4 active fragment peptide sequence. Extendin-4 is a peptide produced in the salivary gland of the Gila Monster lizard. Extendin-4 has been shown to promote insulin secretion, and given in equimolar quantities, is more potent than glucagon-like protein-1 (GLP-1) at causing insulin release from insulin producing cells. GLP-1 is a hormone normally secreted by neuroendocrine cells of the gut, in response to food. GLP-1 fragments or Extendin-4 growth factor fragments can be used in the production of a population of insulin-producing cells from a population of non-insulin producing cells. The methods may also be used to promote pancreatic amylase producing cells to produce both insulin and amylase. The methods are used to treat diabetes mellitus (type 1) in humans, domesticated animals, livestock and pets
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Differentiation of non-insulin producing cells into insulin-producing cells by glucagon-like peptide-1 or extendin-4, used to treat diabetes mellitus.
                                                                                                                                                                                                                                                                                                                                                          Extendin-4; Gila Monster lizard; insulin producing cell; insulin; amylase; diabetes mellitus type 1; human; livestock; pet.

```
This sequence represents an extendin-4 active fragment peptide sequence. Extendin-4 is a peptide produced in the salivary gland of the Gila Monster lizard. Extendin-4 has been shown to promote insulin secretion, and given in equimolar quantilies, is more potent than glucagon-like protein-1 (GLP-1) at causing insulin release from insulin producing cells. GLP-1 is a hormone normally secreted by neuroendocrine cells of the gut, in response to food. GLP-1 fragments or Extendin-4 growth factor fragments can be used in the production of a population of insulinproducing cells from a population of non-insulin producing cells. The methods may also be used to promote pancreatic amylase producing cells to produce both insulin and amylase. The methods are used to treat diabetes mellitus (type 1) in humans, domesticated animals, livestock and pets
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Differentiation of non-insulin producing cells into insulin-producing cells by glucagon-like peptide-1 or extendin-4, used to treat diabetes mellitus.
                                                                                                                                             Extendin-4; Gila Monster lizard; insulin producing cell; insulin; amylase; diabetes mellitus type 1; human; livestock; pet.

The present sequence represents an extendin-3 peptide. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. It is used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Extendin-4; Gila monster lizard; Mexican Beaded lizard; exendin; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; dlabetes.
                                                                                                                                                                                                                                                          Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating

  This sequence represents an extendin-4 active fragment peptide sequence. Extendin-4 is a peptide produced in the salivary gland of the Gila monster lizard. Extendin-4 has been shown to promote insulin secretion, and given in equimolar quantilies, is more potent than glucagon-like protein-1 (GLP-1) at causing insulin release from insulin producing cells. GLP-1 is a hormone normally secreted by neuroendocrine cells of the gut, in response to food. GLP-1 fragments or Extendin-4 growth factor fragments can be used in the production of a population of insulinmethods may also be used to produce pancreatic amylase producing cells to produce both insulin and amylase. The methods are used to treat diabetes mellitus (type 1) in humans, domesticated animals, livestock and pets
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Extendin-3; Gila monster lizard; Mexican Beaded lizard; exendin;

AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level, The method is useful for lowering plasma or glucagonna. The method is also useful for reating the hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Extendin, Gila monster lizard, Mexican Beaded lizard, agonist, glucagon-like peptide, plasma glucagon, necrolytic erythema; glucagonoma; hyperglucagonemia, diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating
                                                                                                                                                                                                                                                                                                                                                                                   AAY94013 Length: 39 February 4, 2005 13:20 Type: P Check: 9131 Found using 'seq4' (mohamed337.key)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Young A,
                                                                                                                                                                                                                                                                                                                diabetes
   The present sequence represents an extendin-4 peptide. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. It is used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level, the method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonema. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Extendin, Gila monster lizard, Mexican Beaded lizard, agonist, glucagonoma, glucagon, necrolytic erythema, glucagonoma,
                                                                                                                                             Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAY94011 Length: 39 February 4, 2005 13:20 Type: P Check: 9570 ound using 'seq4' (mohamed337.key)

lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Extendin; Gila monster lizard; Mexican Beaded lizard; agonist;
glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma;
hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAY94013-43 represent extendin agonists, derived from AAY94012. AMY94013-43 represent extendin agonists, derived from AAV94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level, the method is useful for lowering plasma or glucagonnar. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Extendin, Gila monster lizard, Mexican Beaded lizard, agonist, glucagon-like peptide, plasma glucagon, necrolytic erythema, glucagonoma; hyperglucagonemia, diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating
glucagon levels and/or suppression of glucagon, e.g. type 1 and type diabetes

AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic extythem a r glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                      Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAY94018 Length: 39 February 4, 2005 13:20 Type: P Check: 9567 Found using 'seq4' (mohamed337.key)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level. The method is useful for lowering plasma or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                 Extendin, Gila monster lizard, Mexican Beaded lizard, agonist, glucagon-like peptide, plasma glucagon, necrolytic erythema, glucagonoma, hyperglucagonemia, diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAY94017 Length: 39 February 4, 2005 13:20 Type: P Check: 9804 Found using 'seq4' (mohamed337.key)

 AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin gonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Extendin, Gila monster lizard, Mexican Beaded lizard, agonist; glucagonoma; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma;
                    Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                                                                                                              Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.

AAY94013-43 represent extendin agonists, derived from AAY94012. Extending are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level. The method is useful for lowering plasma glucagon level method is useful for lowering plasma glucagon level method is useful for reating from necrolytic hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAY94020 Length: 39 February 4, 2005 13:20 Type: P Check: 9563 Found using 'seq4' (mohamed337.key)

AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin, agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating erythem and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type I and type 2 diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Extendin; Gila monster lizard; Mexican Beaded lizard; agonist;
glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma;
hyperglucagonemia; diabetes.

                          Young A,
AAY94013-43 represent extendin agonists, derived from AAV94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating glucagon expected plucagon of glucagon of glucagon of glucagon of glucagon, e.g. type I and type 2 diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Extendin; Gila monster lizard; Mexican Beaded lizard; agonist;

                                       AAY94013-43 represent extendin agonists, derived from AAV94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating erythema or glucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type I and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; dlabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.

AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins

```
are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level, method is useful for lowering plasma glucagonma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type I and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAY94013-43 represent extendin agonists, derived from AAY94012. AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating
exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Extendin; Gila monster lizard; Mexican Beaded lizard; agonist;
glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma;
hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                      Check: 9251

AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating erythema or glucagonoma. The method is also useful for treating glucagon levels and/or suppression of glucagon, e.g. type I and type 2 diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
            would benefit from reduced
yon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
hyperglucagonemia and other conditions that would benefit from reduce
glucagon levels and/or suppression of glucagon, e.g. type 1 and type
diabetes

AAV94013-43 represent extendin agonists, derived from AAV94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist. a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level. The method is useful for rowering plasma or glucagonnen. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type I and type 2
                                                                                                                                                                                                                                                                                                                                                                                                      Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plaama glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.

AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon levels, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                   Extendin; Gila monster lizard; Mexican Beaded lizard; agonist;
glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma;
hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAY94029 Length: 39 February 4, 2005 13:20 Type: P Check: 9869

```
AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level, the method is useful for lowering plasma or glucagonnar. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                          Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Type: P Check: 9915
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Extendin; Gila monster lizard; Mexican Beaded lizard; agonist;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  . match found in sequence: aay94032 ; Amino acid sequence of an extendin agonist

Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level. The method is useful for lowering pragman or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                    Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        2005 13:20 Type: P Check: 9430
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               aay94031 ; Amino acid sequence of an extendin agonist.

    AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level. The method is useful for lowering plasma glucagon level. The method is useful for treating from necrolytic extythem are glucagonem. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAY94032 Length: 39 February 4, 2005 13:20 Type: P Check: 9476 ound using 'seq4' (mohamed337.key)

AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic extythem or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Extendin; Gila monster lizard; Mexican Beaded lizard; agonist;
glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma;
hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Type: P Check: 9546
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 match found in sequence:
aay94034 ; Amino acid sequence of an extendin agonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            to: 39

AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level, The method is useful for lowering plasma or glucagonnia. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                     Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAY94035 Length: 39 February 4, 2005 13:20 Type: P Check: 706 Found using 'seq4' (mohamed337.key)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 diabetes
  AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level. The method is useful for lowering blasma glucagonia. The method is also useful for reacting erythema or glucagonema. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
                                                                                                                                                                                                                           Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAY94034 Length: 39 February 4, 2005 13:20 Type: P Check: 9131 Found using 'seq4' (mohamed337.key)

AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level. The method is useful for lowering plasma or glucagonnan. The method is also useful for treating hyperglucagonman and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Extendin; Gila monster lizard; Mexican Beaded lizard; agonist;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          diabetes
AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist. a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level. The method is useful for lowering plasma arguegon non-conditions suffering from necrolytic hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Extendin; Gila monster lizard; Mexican Beaded lizard; agonist;

AMY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist. a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level, The method is useful for lowering plasma or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                  Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAY94039 Length: 39 February 4, 2005 13:20 Type: P Check: 267 Found using 'seq4' (mohamed337.key)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         diabetes
   AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level. The method is useful for lowering plasma or glucagonna. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Extendin; Gila monster lizard; Mexican Beaded lizard; agonist;
glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma;
hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                 Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAY94038 Length: 39 February 4, 2005 13:20 Type: P Check: 458 Found using 'seq4' (mohamed337.key)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type I and type 2 diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAY94040 Length: 39 February 4, 2005 13:20 Type: P Check: 267 Found using 'seq4' (mohamed337.key)

AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level. The method is useful for lowering plasma or glucagonnam. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Extendin, Gila monster lizard, Mexican Beaded lizard, agonist, glucagon-like peptide, plasma glucagon, necrolytic erythema; glucagonoma; hyperglucagonemia, diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAY94043
 lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would banefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagonoma; glucagonoma; hyperglucagonemia; dlabetes.
                                                                                                                                                                                                                                                                                 AAY94013-43 represent extendin agonists, derived from AAY94012. AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating erythema and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type I and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Extendin, Gila monster lizard, Mexican Beaded lizard, agonist, glucagon-like peptide, plasma glucagon, necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Check: 267
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Length: 39 February 4, 2005 13:20 Type: P

The present sequence represents a modified extendin or extendin agonist. Strendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, useful from metrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Extendin; Gila monster lizard, Mexican Beaded lizard; agonist;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAY94046;
The present sequence represents a modified extendin or extendin agonist. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                            Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.

```
The present sequence represents a modified extendin or extendin agonist. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Extendin, Gila monster lizard, Mexican Beaded lizard; agonist;
glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma;
hyperglucagonemia; diabetes.
                                                                                                                                 Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 match found in sequence:
    aay94048 ; Amino acid sequence of an extendin agonist.

    The present sequence represents a modified extendin or extendin agonist. Strendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin auseful for lowering plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.

The present sequence represents a modified extendin or extendin agonist. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would type 1 and type 2 diabetes
                                                                                                                                                                                                                                                                                                                                                          AAY94049 Length: 28 February 4, 2005 13:20 Type: P Check: 231

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAY94050;
 The present sequence represents a modified extendin or extendin agonist. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower blasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating byperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Extendin; Gila monster lizard; Mexican Beaded lizard; agonist;
glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma;
hyperglucagonemia; diabetes.
                                   Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating

The present sequence represents a modified extendin or extendin agonist. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, useful for merolytic erythema or glucagonona. The method is useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a modified extendin or extendin agonist. Strendins are found in the sallywary glands of the Gila monster and Mexican Beaded lizard, anves sequence similarity to glucagon-like peptides. They are used in the method of the invention.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Key
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              8 \pm 6 ```

```
The present sequence represents a modified extendin or extendin agonist. Extendins are found in the salivary glands of the Gila monster and bexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans,
describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also beeful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g.
 Extendin, Gila monster lizard, Mexican Beaded lizard, agonist;
glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma;
hyperglucagonemia; diabetes.
 Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
 Type: P Check: 151
 an extendin agonist.
 Amino acid sequence of an extendin agonist.
 /note= "amidated residue"

Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.

Disclosure; Fig 4A; 96pp; English.

The present sequence represents a modified extendin or extendin agonist. Extendins are found in the salivary glands of the Gila monster and have sequence similarity to glucagon-like petiddes. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also beseful for treating byperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g.

The present sequence represents a modified extendin or extendin agonist. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin, an exendin agonist. a modified exendin or a modified exendin sonist. These compounds lower plasma glucagon level. The method is suffering from necrolytic erythema or glucagon level. The method is suffering from necrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2 dlabetes
 Extendin; Gila monster lizard; Mexican Beaded lizard; agonist;
glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma;

The present sequence represents a modified extendin or extendin agonist. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans,
 Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
 suffering from necrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g.
 Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating

The present sequence represents a modified extendin or extendin agonist. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin or suffering plasma glucagon level. The method is useful for lowering plasma glucagon level. The method is useful for mecrolytic erythema or glucagonoma. The method is also useful for mecrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g.
 Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.

```
The present sequence represents a modified extendin or extendin agonist. Extendins are found in the salivary glands of the Gila monster and Mexican Baeded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower blasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating by begralucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g.
 Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
 Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.

Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is suffering from necrolytic erythema or glucagonnes, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g.
 Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
 Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating

 The invention provides a pharmaceutical composition that comprises a molecule selected from a glucagon-like-peptide-1 (GLP-1) molecule, growth hormone releasing factor (GRF) molecule or a parathyroid hormone (PTH) molecule. The composition further includes a weak acid such as acetic acid. The pH of the composition is 3 - 5. The composition can be used for the treatment of a disease or condition selected from diabetes, excess appetite, obesity, stroke, ischemia, reperfusion injury, disturbed glucose metabolism, surgery, coma, shock, gastrointestinal disease, diabetes, inver disease, atherosclerosis, vascular disease, gestational diabetes, liver disease and cirrhosis, glucocriticoid excess, Cushing's disease, the presence of activated counter regulatory hormones that occur after trauma or a disease, hypertriglyceridemia, chronic pancreatitis, the need for parenteral feeding, and a catabolic state following surgery or injury. Sequences ABB0149-15s represent peptide fragments from gila monster venomes that are homologous to GLP-1 molecules and can be included
 GLP-1; glucagon-like-peptide-1; growth-hormone releasing factor; GRF; parathyroid hormone; PTH; antidiabetic; anoretic; cerebroprotective; vasotropic; anti-inflammatory; antiarteriosclerotic; hepatotropic; tranquilizer; vulnerary; osteopathic; gila monster; exendin.

The invention relates to the treatment of hibernating myocardium by administering a GLP-1 (glucagon like peptide-1) molecule. GLP-1 activity may be described as, cardiant, antidiabetic and vasotropic. GLP-1 may be used for treating, hibernating myocardium, congestive heart failure, ischaemic cardiomyopathy and diabetic cardiomyopathy. GLP-1 reduces plasma or heart norepinepherine level in a patient. The current sequence represents the glucagon like peptide-1 (GLP-1) known as exendin 3

The present invention relates to analogues of glucagon-like peptide-1, comprising glucagon-like peptide-1 (GLP-1) modified with a reactive group that reacts with a thiol group on a blood component to form a covalent bond, where the reactive group is chosen from an activated disulfide bond group or an S-sulfonate. The analogues are useful for manufacturing madicament and treating non-insulin dependent diabetes, obssity, stroke, myocardial infraction, stress-induced hyperglycaemia or irritable bowel syndrome. The present sequence is a peptide shown in the exemplification
 Novel glucagon-like peptide-1 compound comprising glucagon-like peptide-1 modified with reactive group that reacts with thiol group on blood component to form covalent bond, useful for treating obesity, stroke.

The invention relates to novel analogues of exendin-4 (ABP58572-ABP58576) or their pharmaceutically acceptable salts. The invention also encompasses a procedure for preparing the exendin-4 analogues. Exendin-4 (ABP58578) is a polypeptide obtained from the Mexican beaded lizard (Heloderma horridum) which acts as an agonist of glucagon-like peptide 1 (GLP-1, see ABP58577). Like exendin-4 fiself, the exendin-1 analogues of the invention have antidiabetic activity, being able to promote the secretion of insulin and reduce blood sugar, and are thus applicable in treating type 2 diabetes. Oil micrograms of an exendin-4 analogue was common alternated to be able to reduce blood sugar to approximately 20% of its former value after one hour, and its effects lasted 30 minutes longer than 4 micrograms of insulin. The exendin-4 analogues of the invention permitting large-scale production. The present sequence represents wild: type exendin-4 which is referred to in the disclosure of the invention
 Polypeptide exendin-4 derivatives, useful for promoting insulin secretion and reducing blood sugar, for treating diabetes type 2.

The invention relates to a method for treating polycystic ovary syndrome (PCOS). The method comprises administering a glucagon-like peptide-1 (GLP -1) molecule. The method of the invention has gynecological.

CC antidiabetic, anorectic, hypotensive, antilipaemic, antilifertility, depilatory, andocrine-gen., antiseborrheic, and dermatological activity. CC A GLP-1 molecule of the invention acts as plasma glucose regulator, or insulin secretion stimulator. The method is useful for treating polycystic ovary syndrome (PCOS) and its symptoms, particularly insulin cesistance, hyperinsulinemia, type-2 diabetes, obesity, hypertension, hyperilpidaemia, anovulation or irregular ovulation, infertility. Chyperadrogenism, hirsutism, alopecia, acne, enlarged multifollicular ovaries, abnormal uterine bleeding and spontaneous abortion, and for restoring regular menses, ovulation and fertility. A GLP-1 molecule reduces insulin resistance or increases insulin sensitivity. The present equipment of the present requesents a Gila monster venom peptide, exendin 3, which shows Sequence 39 AA; homology 

The present invention relates to an adenoviral vector comprising a polymucleotide sequence encoding glucagon-like peptide 1 (GLP-1) or glucose-dependent insulinotropic peptide (GIP), a polymucleotide sequence encoding a signal sequence upstream of it, and a polymuclaotide sequence constream of it. The viral vector is useful in gene therapy for treating type II diabetes, obesity and related conditions by in vivo expression of GLP-1, and/or GIP. The treatment may be combined with the administration of dipeptidyl peptidase IV (DPP-IV) inhibitors. ABU91969-ABU91975 represent GLP-1, GLP-1 variant, exendin or GIP peptides

The invention relates to a method for treating polycystic ovary syndrome (PCOS). The method comprises administering a glucagon-like peptide-1 (GLP -1) molecule. The method of the invention has gynecological.

artidiabetic, anorectic, hypotensive, antilipaemic, antilinfertility, depilatory, andocrine-gen., antiseborrheic, and dermatological activity.

A GLP-1 molecule of the invention acts as a plasma glucose regulator, or insulin secretion stimulator. The method is useful for treating polycystic ovary syndrome (PCOS) and its symptoms, particularly insulin polycystic ovary syndrome (PCOS) and its symptoms, particularly insulin the present anovulation or irregular ovulation, infertility, hyperandrogenism, hirsutism, alopecia, acne, enlarged multifollicular ovaries, abnormal uterine bleeding and spontaneous abortion, and for restoring regular menses, ovulation and fertility. A GLP-1 molecule reduces insulin resistance or increases insulin sensitivity. The present control of the present of the presen

Method for the treatment or prevention of intermittent claudication or skeletal muscle injury caused by ischemia and/or reperfusion in a human subject, comprises administration of a glucagon-like peptide-1 molecule.

Disclosure; Page 4; 12pp; English

```
The ivention describes a method for the treatment or prevention of intermittent claudication or skeletal muscle injury caused by ischaemia and/or reperfusion in a human subject, comprising the administration of a glucagon-like peptide-l (GLP-l) molecule. The method is useful for treating or preventing intermittent claudication or skeletal muscle suffering from peripheral vascular disease (PVD). Administration of GLP-l in a subject improves skeletal muscle performance by promoting glucose socidation and reducing fatty acid oxidation. This is the amino acid sequence of a mammalian glucagon-like peptide-l peptide GLP-l(1-37) that can be used in the method of the invention.

The present invention describes derivatives (A1) of GLP-1 (glucagon-like peptide-1) (7-c) (with c = 35 or 36) having just one lipophilic computations (LS) attended to the C-terminal amino acid (aa) and derivatives (A2) of exendin with LS attended to at least one as of the parent peptide. Al excludes compounds Arg26, Arg34, Lys36-(N-core carboxyx) GLP-1 (7-36)-CM, where X = nonadecanoyl, checanoyl or heptanoyl. Also described are compositions containing A1 and A2 plus a vehicle or carrier. A1 and A2 have containing A1 and A2 plus a vehicle or carrier. A1 and A2 have atteinable tis anti-order of insulin notropic and hypoglycaemic activities. A1 stimulates secretion of insulin but suppresses that of glucagon. They also inhibit gastric emptying and pancreatic secretion and may reduce food intake. A1 and A2 are used to treat (non-)insulin-dependent diabetes militus and obesity, and also to prevent hyperglycaemia. A1 and A2 have a greater persistence in vivo than corresponding peptides without LS (because of reduced sensitivity to dispetidyl peptidases). When corresponding peptides without LS cormulated with other antidiabetic agents, they often produce a synergistic effect. The present sequence represents an exendin derivative parent peptide, which is used in the exemplification of the present
 New derivatives of glucagon-like peptide-1 and exendin containing lipophilic substituent, for treating diabetes and obesity.

Identifying substances with a specific activity in target organisms, useful for drug development, by detecting compounds with related activity in reference organisms.

Example 1; Page 28; 76pp; German.

This invention describes a novel method for discovering a substance that is pharmaceutically active in a target organism. The method comprises generating an EST (expressed sequence tag) library from the reference organism or tissue and identifying active compounds in the reference organism or tissue and identifying active compounds in the reference organism or tissue and identifying active compounds in the reference organisms are used, to allow identification of least two reference organisms are used, to allow identification of conserved structures, which are then used to identify orthologous structures are then structures in the target. Optionally the orthologous structures are then conserved structures, based optimisation of the required properties. The method is used to identify polypeptides which are then used optionally after optimisation of properties, as pharmaceuticals, or after validation as a drug target, for development of ligands, also potential pharmaceuticals. Polypeptides and nucleic acids encoding them, can also be used for identification and validation of drug targets and concentrated facilitates discovery of agents that are biologically active, for identification and validation of drug targets and concidentally in humans, and should reduce the time between discovery and development of new drugs, since previous understanding of molecular concerns and pathology or of the structures involved in drug design are not necessary. The identified drugs will usually be very specific, with reduced side effects. Sequencing of a cDNA bank from the mexican bearded concerns an published databases, encoded a 196 amino acid precursor of natriuretic peptide. Analysis of corresponding sequences from other republished that the effects of the new sequence probably contractions of natriuretic peptide. Analysis of corresponding sequences from other corresponding showed that the N-terminal region of the new sequence probably. encodes peptides that potentiate the effect of bradykinin and inhibit angiotensin-converting enzyme.

New albumin fusion protein, useful for preparing a composition for treating diabetes mellitus.

Disclosure, SEQ ID NO 202; 1086pp; English.

The invention relates to fusion proteins comprising human serum albumin (ADH21530) and a therapeutic polypeptide such as a therapeutic protein, antibody or peptide or their variants or fragments. The therapeutic control of protein may be fused to the N-terminus, the C-terminus or both termini of albumin via a linker. The albumin component of the fusion proteins compared with those of the corresponding therapeutic proteins compared with those of the corresponding therapeutic proteins on their own. The invention also relates to nucleic acids encoding albumin fusion protein nucleic acid, compositions and kits comprising an albumin fusion protein, the method of extending the shelf-life of a therapeutic protein by fusion with albumin, and the treatment of disease using an albumin fusion protein. The albumin fusion proteins may be used to the treatment of methodic-fendocrine disorders, diabetes and diabetes. The treatment of methodic-fendocrine disorders, diabetes and diabetes contracted conditions. Specifically the albumin fusion proteins may be used to treat type 1 and type 2 diabetes, hyperglycaemia, neural disorders (especially neuropathy), retinopathy, cardiovascular disorders (especially neuropathy), retinopathy, cardiovascular disorders also be used in a method of maintaining a basal glucose level in a patient and in a method of maintaining a basal glucose level in a method of maintaining a besent sequence is

This invention relates to a novel method for the prevention and intervention into Type 1 diabetes and Latent Autoimmune Diabetes in the Adult (LADA). Specifically, it refers to the administration of a modulator derived from a CD3 and GLP-1 compound. This combined treatment provides a synergistic effect and GLP-1 compound. This combined treatment provides a synergistic effect and can attenuate the further destruction of beta-cells, hence improving glycaemic control in diabetic patients. Furthermore, it can be used as a prophylactic for people at high risk for the development of type I diabetes and can provide an improved prognosis with respect to microvascular and macrovascular complications. The present invention describes exendin, a GLP-1 compound that is insulinotropic, as well as analogues and fragments derived thereof that can be used to modulate beta cell function. Accordingly, the compositions of this invention exhibit immunosuppressive and antidiabetic activities. This peptide sequence is a GLP-1 compound, the exendin peptide of the

 The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperelycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
 Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
 exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gaetric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.

THE KAME WAS A STANDED AND A STANDARD A STA
 The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasms alucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
 Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
 exendin; extended-release formulation; plasma level; antidiabetic; antidipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.

formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obssity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention

Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation
```

Disclosure; SEQ ID NO 55; 173pp; English

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predecermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 5.5$ of the predetermined release period. The composition has antidiabetic, anorectic, and antilippemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovaccular disease. This sequence
 Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
 exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia;

WPI; 2004-042706/04.

Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.

Disclosure; SEQ ID NO 91; 173pp; English

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount that, when the composition is administered to a human, an average sustained plasma level of at least 5 gydm is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method

```
The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predecermined release period, the period being at least one hour, and in amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
are useful in treating diabetes and conditions that would be benefited by

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperelycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention. Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation. exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; Type: P Check: 5882 . match found in sequence: ad166293; Exendin agonist peptide, SEQ ID No 173. Novel glucagon-like peptide-1 receptor agonist or modified GLP-1 receptor agonist, useful for treating diabetes, impaired glucose tolerance, metabolic syndrome or pre-diabetic state. 

Example 1, SEQ ID NO 3; 56pp; English.

The present sequence is that of extendin 4, an example of a glucagon-like peptide 1 (GLP-1) receptor agonist. Modified GLP-1 receptor agonists of the invention comprise a GLP-1 receptor agonist such as the present peptide linked to a polyethylen glycol polymer having a molecular weight of greater than 30 kDa. The modified GLP-1 receptor agonists are useful for treating type 1 diabetes, type 2 diabetes, maturity onset diabetes of the young, latent autoimmune diabetes adult, gestational diabetes and Syndrome X (all claimed). They can also be used to treat hyperglycaemia, impaired glucose tolerance, impaired fasting glucose and obesity caused by inducing glucose-dependent insulin secretion. They may also be effective in the treatment of obesity, atherosclerotic disease, hyperlipidaemia, hyperrholesterolaemia, low high density lipoprotein levels, hypertension, cardiovascular disease (including atherosclerosis, coronary heart disease and hypertension), cerebrovascular disease,

peripheral vessel disease, physiological disorders and the secondary causes of diabetes. The modified GLP-1 receptor agonists can be prepared by synthetic or recombinant methods. They induce glucose-dependent insulin secretion without reducing gastrointestinal motility, thereby lessening the gastrointestinal side-effects associated with previous GLP-1 receptor agonists. 8\$\$\$\$\$\$\$\$\$\$

Purifying fermentation-derived product such as interleukins, insulin, albumin, involves microfiltration of fermentation broth containing fermentation-derived product at specific microfiltration temperature and isolating final product

Claim 25; Page 17; 20pp; English.

This invention relates to a novel method of purifying a fermentation-derived product, which involves microfiltration of a fermentation broth containing the fermentation-derived product at a microfiltration temperature within the range from 66-90 degrees C and isolating the final product. The method of the invention is efficient in purifying a fermentation-derived product with an improved microfiltration process comprising elevated temperatures. The present sequence is that of an exendin-4 analogue ZP10 peptide which is a fermentation-derived product to which the method of the invention may be applied.

This invention relates to a novel method of preventing and/or delaying diabetes in a subject in need, which involves administering to the subject an effective amount of a compound that increases beta-cell proliferation and/or reduces beta-cell apoptosis in the subject. The invention may be useful for the production of compounds with an antidiabetic or immunosuppressive activity by increasing expression of protein kinase (Aktl and/or p44MAPK) in the beta-cells and decreasing caspase-3 activation. The method is useful for preventing and/or delaying diabetes in a subject. The present sequence is that of a human exendin-4 peptide which is related to the method of the invention.

The invention relates to a method of ameliorating a neurological disorder is in a subject, which comprises administering a therapeutical amount of a dilatide peptide or its functional analogue, where the administration of the Gilatide peptide or its functional analogue, where the administration of the Gilatide peptide or its functional analogue inhibits or delays the conset of the neurological disorder. Also described is the Gilatide of an encoding nucleic acid. The methods, composition, the nucleic acid and the encoded peptide are useful in preventing or delaying the conset of a memory disorder and in treating a neurological disorder, i.e. a neurodegenerative disorder, e.g. seizures, strokes, brain ischaemia or epilepsy. Other diseases include Parkinson's disease, Alaheimer's disease, Huntington's disease or ALS. The peptides are also useful in modulating blood glucose and in preventing and treating glucose.

The metabolism disorders, e.g., obesity, diabetes, anorexia nervosa, chromismia or atherosclerosis. The present sequence represents an extendin-4 peptide used as a Gilatide peptide of the invention.

Use of an incertin, a glucagon-like peptide-1, an exendin or a compound that binds to a receptor for glucagon-like peptide-1, in the manufacture of a medicament for the prevention or treatment of nephropathy.

Disclosure; SEQ ID NO 12; 50pp; English.

ö The present invention describes an incretin, a glucagon-like peptide-1 (GLP-1), an exendin or a compound that binds to a receptor for GLP-1, or their agonist, analogue, derivative or variant or fragment (I), that is

```
used in the manufacture of a medicament for the prevention or treatment of nephropathy. (I) has nephrotropic, antidiabetic and hypotensive activities. (I) can be used in the manufacture of a medicament for the prevention or treatment of nephropathy; preventing progression of nephropathy to end stage renal disease (BSRD); improving endothelial function in the treatment of reduced vasodilatory capacity; reducing proteinuria; and preventing or alowing progression of glomeruloselerosis associated with insulin resistance, diabetes and hypertension. The compounds act in part by improving insulin resistance, cation balance, hypertension and/or by facilitating glucose oxidation; including that by endothelial cells in the kidney and by other cells, rather by oxidation of free fatty acids; and so leads to an enhanced production of ATP for use by the cells and reduces oxidative stress on the affected tissue. The present sequence represents an exendin-3 peptide, which is given in the exemplification of the present invention.

manufacture Use of an incertin, a glucagon-like peptide-1, an exendin or a compound that binds to a receptor for glucagon-like peptide-1, in the manufacture of a medicament for the prevention or treatment of nephropathy.

Disclosure; SEQ ID NO 14; 50pp; English.

The present invention describes an incretin, a glucagon-like peptide-1 (GLP-1), an exendin or a compound that binds to a receptor for GLP-1, or

proteinuria, and preventing or slowing progression of glomerulosclerosis associated with insulin resistance, diabetes and hypertension. The compounds act in part by improving insulin resistance, cation balance, hypertension and/or by facilitating glucose oxidation; including that by endothelial cells in the kidney and by other cells, rather by oxidation of free fatty acids; and so leads to an enhanced production of APP for use by the cells and reduces oxidative stress on the affected tissue. The present sequence represents an exendin-4 peptide, which is given in the their agonist, analogue, derivative or variant or fragment (I), that is used in the manufacture of a medicament for the prevention or treatment of nephropathy. (I) has nephrotropic, antidiabetic and hypotensive activities. (I) can be used in the manufacture of a medicament for the prevention or treatment of nephropathy; preventing progression of nephropathy to end stage renal disease (ESRD); improving endothelial function in the treatment of reduced vasodilatory capacity; reducing exemplification of the present invention 888888888888888888

Use of an incertin, a glucagon-like peptide-1, an exendin or a compound that binds to a receptor for glucagon-like peptide-1, in the manufacture of a medicament for the prevention or treatment of nephropathy

Disclosure, SEQ ID NO 19; 50pp; English.

The present invention describes an incretin, a glucagon-like peptide-1 (GLP-1), an exendin or a compound that binds to a receptor for GLP-1, or their agonist, analogue, derivative or variant or fragment (1), that is used in the manufacture of a medicament for the prevention or treatment of nephropathy. (1) has nephrotropic, antidiabetic and hypotensive

```
activities. (I) can be used in the manufacture of a medicament for the prevention or treatment of nephropathy; preventing progression of function and stage renal disease (SSBD); improving endothelial function in the treatment of reduced vasodilatory capacity; reducing proteinuria; and preventing or slowing progression of glomerulosclerosis associated with insulin resistance, diabetes and hypertension. The compounds act in part by improving insulin resistance, cation balance, hypertension and/or by facilitating glucose oxidation; including that by endothelial cells in the kidney and by other cells, rather by oxidation of free fatty acids; and so leads to an enhanced production of ATP for use by the cells and reduces oxidative stress on the affected tissue. The present sequence represents an exendin analogue peptide, which is given
 in the exemplification of the present invention.

Use of an incertin, a glucagon-like peptide-1, an exendin or a compound that binds to a receptor for glucagon-like peptide-1, in the manufacture of a medicament for the prevention or treatment of nephropathy.

Disclosure; SEQ ID NO 20; 50pp; English.

The present invention describes an incretin, a glucagon-like peptide-1 (GLP-1), an exendin or a compound that binds to a receptor for GLP-1, or their agonist, analogue, derivative or variant or fragment (I), that is used in the manufacture of a medicament for the prevention or treatment

prevention or treatment of negative preventing progression of mephropathy to end stage renal disease (ESRD); improving endothelial function in the treatment of reduced vasodilatory capacity; reducing proteinuria; and preventing or slowing progression of glomeruloscierosis associated with insulin resistance, diabetes and hypertension. The compounds act in part by improving insulin resistance, cation balance, hypertension and/or by faciliteting glucose oxidation; including that by endothelial cells in the kidney and by other cells, rather by oxidation of free fatty acids; and so leads to an enhanced production of ATP for use by the cells and reduces oxidative stress on the affected tissue. The present sequence represents an exendin analogue peptide, which is given of nephropathy. (I) has nephrotropic, antidiabetic and hypotensive activities. (I) can be used in the manufacture of a medicament for the in the exemplification of the present invention.

prevention or treatment of negative and a measurement of the prevention or treatment of negative and preventing progression of nephropathy to end stage renal disease (ESRD); improving endothelial function in the treatment of reduced vasodilatory capacity; reducing proteinuria; and preventing or slowing progression of glomerulosclerosis associated with insulin resistance, diabetes and hypertension. The compounds act in part by improving insulin resistance, cation balance, hypertension and/or by facilitating glucose exidation; including that by endothelial cells in the kidney and by other cells, rather by exidation of free fatty acids; and so leads to an enhanced production of ATP for use by the cells and reduces exidative stress on the affected tissue. The present sequence represents an exendin analogue peptide, which is given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Use of an incertin, a glucagon-like peptide-1, an exendin or a compound that binds to a receptor for glucagon-like peptide-1, in the manufacture of a medicament for the prevention or treatment of nephropathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       incretin; glucagon-like peptide-1; GLP-1; exendin; nephropathy; nephrotropic; antidiaberic; hypotensive; end stage renal disease; ESRD; proteinuria; glomerulosclerosis; insulin resistance; diabetes; hypertension.
their agonist, analogue, derivative or variant or fragment (I), that is
                used in the manufacture of a medicament for the prevention or treatment of nephropathy. (I) has nephrotropic, antidiabetic and hypotensive activities. (I) can be used in the manufacture of a medicament for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes an incretin, a glucagon-like peptide-1

their agonist, analogue, derivative or variant or fragment (1), that is used in the manufacture of a medicament for the prevention or treatment of nephropathy. (1) has nephrotropic, antidiabetic and hypotensive activities. (1) can be used in the manufacture of a medicament for the prevention or treatment of nephropathy; preventing progression of prevention or treatment of nephropathy; preventing progression of prevention or treatment of nephropathy; preventing progression of proteinuria, and preventing or slowing progression of glomerulosclerosis associated with insulin resistance, diabetes and hypertension. The compounds act in part by improving insulin resistance, cation balance, hypertension and/or by facilitating glucose oxidation; including that by endothelial cells in the kidney and by other cells, rather by oxidation of fee fatty acids, and so leads to an enhanced production of Arp for use by the cells and reduces oxidative stress on the affected tissue. The present sequence represents an exendin analogue peptide, which is given in the exemplification of the present invention. \$

Use of an incertin, a glucagon-like peptide-1, an exendin or a compound that binds to a receptor for glucagon-like peptide-1, in the manufacture of a medicament for the prevention or treatment of nephropathy.

Disclosure; SEQ ID NO 24; SOpp; English

The present invention describes an incretin, a glucagon-like peptide-1 (GLP-1), an exendin or a compound that binds to a receptor for GLP-1, or their agonist, analogue, derivative or variant or fragment (I), that is used in the manufacture of a medicament for the prevention or treatment of nephropathy. (I) has nephrotropic, antidiabetic and hypotensive of antidiabetic and hypotensive of antidiabetic and hypotensive of antidiabetic and hypotensive prevention or treatment of nephropathy; preventing progression of prevention or treatment of reduced vasodilatory capacity; reducing proteinuria, and preventing or slowing progression of glomerulosclerosis associated with insulin resistance, diabetes and hypertension. The compounds act in part by improving insulin resistance, cation balance, hypertension and/or by facilitating glucose oxidation; including that by endothelial cells in the kidney and by other cells, rather by oxidation of free fatty acids; and so leads to an enhanced production of ATP for use by the cells and reduces oxidation; estress on the affected tissue. The present sequence represents an exendin analogue peptide, which is given the exemplification of the present invention. 8\$888888888888888888888888

Use of an incertin, a glucagon-like peptide-1, an exendin, or a compound that binds to a receptor for glucagon-like peptide-1 in the treatment of cardiac arrhythmias by metabolic intervention.

Disclosure; SEQ ID NO 12; 49pp; English.

The present sequence is that of the exendin-3 peptide of Heloderma harridum. This is a glucose-dependent insulinotropic peptide that

```
compounds or their broade uptake without inducing dangerous hyperglycaemia. The present invention provides methods and compositions cor for preventing and treating cardiac arrhythmias. The compositions comprise extendin, GLP-1, an incretin, a compound that binds to a receptor for GLP-1, or an agonist, analogue, derivative or variant of these compounds or their biologically active fragments. These compounds enhance peripheral glucose uptake by potentiating insulin secretion without inducing dangerous hypoglycaemia. They are effective at maintaining the electrochemical gradient across cardiac cellular membranes, thereby reducing the likelihood of arrhythmias developing. They also strongly suppress glucagon secretion, independent of its insulinotropic action, and thereby reduce plasma free fatty acid (FFA) levels substantially more than can be accomplished with insulin. High FFA levels been implicated as a major toxic mechanism during myocardial ischaemia. The compounds can be administered by injection following an ischaemic event or a cardiac intervention such as angioplasty, coronary bypass grafting or placement of an intracoronary stent, and can be used to treat or prevent ventricular arrhythmias such as cardiac ischaemia, cardiac incremican cardi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is that of exendin-4 of Heloderma suspectum. This is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Use of an incertin, a glucagon-like peptide-1, an exendin, or a compound that binds to a receptor for glucagon-like peptide-1 in the treatment of cardiac arrhythmias by metabolic intervention.

cardiac arriptthmias. The compositions comprise exendin, GLP-1, an incretin, a compound that binds to a receptor for GLP-1, or an agonist, an aloque, derivative or variant of these compounds or their biologically active fragments. These compounds enhance peripheral glucose uptake by active fragments. These compounds enhance peripheral glucose uptake by potentiating insulin secretion without inducing dangerous hypoglycaemia. They are effective at maintaining the electrochemical gradient across cardiac cellular membranes, thereby reducing the likelihood of arrhythmias developing. They also strongly suppress glucagon secretion, independent of its insulincropic action, and thereby reduce plasma free fatty acid (FFA) levels substantially more than can be accomplished with insulin. High FFA levels substantially more than can be accomplished with insulin. High FFA levels substantially more than can be accomplished with insulin. High FFA levels substantially more than can be accomplished with injection following an ischemia. The compounds can be administered by injection following an ischaemic event or a cardiac intervention such as angioplasty, coronary bypass grafting or placement of an intracoronary sent, and can be used to treat or prevent ventricular arrhythmias such as cardiac ischaemia, cardiac ischaemia, reperfusion and congestive heart failure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Use of an incertin, a glucagon-like peptide-1, an exendin, or a compound that binds to a receptor for glucagon-like peptide-1 in the treatment of cardiac arrhythmias by metabolic intervention.
a glucose-dependent insulinotropic peptide that enhances peripheral glucose uptake without inducing dangerous hyperglycaemia. The present invention provides methods and compositions for preventing and treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is that of exendin-4 (1-30) peptide derived from Heloderma suspectum exendin-4 ADQ28643. It is an example of exendin analogues of the invention. The present invention provides methods and compositions for preventing and treating cardiac arrhythmias. The

to a receptor for GLP-1, or an agonist, analogue, derivative or variant of these compounds or their biologically active fragments. These compounds enhance peripheral glucose uptake by potentiating insulin secretion without inducing dangerous hypoglycaemia. They are effective at maintaining the electrochemical gradient across cardiac cellular membranes, thereby reducing the likelihood of arrhythmias developing. They also strongly suppress glucagon secretion, independent of its insulinotropic action, and thereby reduce plasma free fatty acid (FFA) levels substantially more than can be accomplished with insulin. High FPA levels have been implicated as a major toxic mechanism during myocardial ischaemia. The compounds can be administered by injection following an ischaemic event or a cardiac intervention such as angioplasty, coronary bypass grafting or placement of an intracoronary stent, and can be used to treat or prevent ventricular arrhythmias such as cardiac ischaemia,

Use of an incertin, a glucagon-like peptide-1, an exendin, or a compound that binds to a receptor for glucagon-like peptide-1 in the treatment of cardiac arrhythmias by metabolic intervention.

Disclosure; SEQ ID NO 22; 49pp; English

The present sequence is that of 14Leu, 25Phe exendin-4 amide derived from Heloderma suggectum exendin-4 ADQ26643. It is an example of exendin analogues of the invention. The present invention provides methods and compositions for preventing and treating cardiac arrhythmias. The compositions comprise exendin, GLP-1, an incretin, a compound that binds to a receptor for GLP-1, or an agonist, analogue, derivative or variant of these compounds or their biologically active fragments. These compounds enhance peripheral glucose uptake by potentiating insulin secretion without inducing dangerous hypoglycaemia. They are effective at maintaining the electrochemical gradient across cardiac cellular cardiac action, and thereby reduce plasma free fatty acid (FFA) insulinocropic action, and thereby reduce plasma free fatty acid (FFA) clevels substantially more than can be accomplished with insulin. High FFA levels been implicated as a major toxic mechanism during myocardial schaemia. The compounds can be administered by injection following an ischaemia. The compounds can be administered by injection following an ischaemia revent or a cardiac intervention such as angioplasty, coronary bypass grafting or placement of an intracoronary stent, and can be used to the cardiac ischaemia, reperfusion and congestive heart failure.

Use of an incertin, a glucagon-like peptide-1, an exendin, or a compound that binds to a receptor for glucagon-like peptide-1 in the treatment of

The present sequence is that of 14Leu, 25phe exendin-4 (1-28) amide derived from Heloderma suspectum exendin-4 ADQ28643. It is an example of exendin analogues of the invention. The present invention provides exendin analogues of the invention. The present invention provides can ethods and compositions for preventing and treating cardiac arrhythmias. The compositions comprise exendin, GLP-1, an incretin, a compound that binds to a receptor for GLP-1, or an agonist, analogue, derivative or compounds enhance peripheral glucose uptake by potentiating insulin secretion without inducing dangerous hypoglycaemia. They are effective at maintaining the electrochemical gradient across cardiac cellular membranes, thereby reducing the likelihood of arrhythmias developing. They also strongly suppress glucagon secretion, independent of its insulinotropic action, and thereby reduce plasma free fatty acid (FFR) levels musterially more than can be accomplished with insulin. High FFA levels have been implicated as a major toxic mechanism during myocardial schaemia. The compounds can be administered by injection following an ischaemic event or a cardiac intervention such as angloplasty, coronary bypass grafting or placement of an intracoronary stent, and can be used to treat or prevent ventricular arrhythmias such as cardiac ischaemia, cardiac arrhythmias by metabolic intervention. -I. FUNCTION: Has a VIP/secretin-like biological activity. Interacts

With the exendin receptor.

-I. SUBCELULAR IOCATION: Secreted.
-I. SIBLIARITY: Belongs to the glucagon family.

has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying or reducing food intake
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Exendin, agonist, treatment, antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.

                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying or reducing food intake
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which
                                                                                                                                                                                  New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Exendin, agonist; treatment; antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     formulations comprising an exendin or exendin agonist peptide used increasing the sensitivity of a subject to insulin to treat diabetes.

This invention describes a novel formulation (1) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Type: P Check: 9131

This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
                                                                Exendin; agonist; treatment; antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Exendin; agonist; treatment; antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                                                                                                                                                                                           New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAB11126 Length: 30 February 4, 2005 13:32 Type: P Check: 4889 Found using 'seq5' (mohamed337.key)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      to: 30

                                                                                                                                                                                                                                                                                                                              This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying or reducing food intake
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Exendin; agonist; treatment; antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.
                                          New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                             Check: 249

This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the ensativity of a subject to insulin to treat diabetes and disorders would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
Exendin; agoniet; treatment; antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Type: P Check: 231
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               match found in sequence:

This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
